

water absorption granules

*Also available in
4 and 8 kg buckets*

**Good to absorb
up to 200 liters
of water**

***Makes wet
places super
fast dry.***

Makes wet places super fast dry.

Water absorption granules are the solution for excess water on flat roofs. Water absorption granules absorb up to 200x their own weight of water within a few minutes.

Application:
For roof or gutter repairs on roofs with a lot of water.

Instruction:

- Sprinkle the granules around the wet spot that you want to repair, so that a dyke arises.
- Allow the granules to stand in for 3-5 minutes. A solid barrier has now been created around the repair site. Water can no longer flow to it. See example photos on this label.
- If the substrate is not dry, you can also apply a thin layer of granules at the repair site.
- Suck or wipe the wet granules.

Disposal: The granules are environmentally friendly and non-toxic. You can dispose of them with the household waste or spread them on the roof, after which they dissolve in the excess water.

Health: Not harmful to the skin. Avoid contact with mouth and eyes.

Beware! Never walk in the wet granules. This causes slippery shoe soles and a high risk of slipping.
